Examiner's Reasons for Allowance

The following is an examiner's statement of reasons for allowance:

Referring to claims 20-29, the prior art searched and of record neither anticipates nor suggests in the claimed combinations, predicting an amount of the image data obtained from received PDL data compressed by the compression method utilized for the facsimile communication based on at least a size of a recording paper and a predetermined compression rate utilized in the compression method before storing the compressed image data in the memory and judging whether the predicted amount of the compressed image data can be stored in the memory.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Cited Prior Art

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Nakao (US 20010024522 A1) discloses a compression rate predicting section for computing an improving rate of compression required for storing image data of the entire document in an image data storage section. For details on how the improving rate of compression is determined, see paragraphs 37-40.

Murphy (US 6031624 A) discloses a printer that must decide how much data of a particular page should be buffered within the printer before commanding the print engine to start moving the print media. The printer is capable of making this "data size" to be buffered decision without any assistance from the host computer that is sending the print job to the printer and the host need send only the standard page header information that all host computers send when transmitting a rasterized print job to a printer. The printer bases its "data size" decision by estimating the amount of data by using the print resolution, an estimate of the compression ratio, and other information from the page header that provides a rough estimate as to how much of the area of the page of the print media is to be covered, and by estimating the communication link speed, and the amount of time that is available to perform the data transfer.
